

⚡ // AUTONOMOUS MULTI-AGENT SYSTEM

CAREEROS

Autonomous Multi-Agent Career Optimization Engine

Maximizing the probability of landing interviews and offers, autonomously.

[08:00 TRIGGER]

[MULTI-AGENT]

[ATS-AWARE]

BUILT WITH FASTAPI · NEXT.JS 15 · LLAMA 70B

The Core Objective: Maximizing Interview Probability

// THE_DRAG

Wasting hours browsing boards
and manually tailoring resumes is
a losing game.

[FRICTION_RATE: HIGH]

// THREE_CORE_PILLARS

01 / NOT_A_BUILDER

Not a Resume Builder

Designed to maximize the probability of receiving interviews and offers — not just produce prettier PDFs.

02 / ACTIVE_VS_PASSIVE

Active vs. Passive

Unlike traditional prompt-based AI builders, CareerOS runs 24/7 in the background discovering jobs and prepping assets.

03 / IDEAL_UX

Ideal UX

Users spend only 5 minutes reviewing and submitting applications instead of hours preparing them.

Automated Job Discovery (08:00 AM Trigger)

// 08:00_AM

08:00

INLINE SCHEDULER TRIGGER

Fresh opportunities are pulled every morning at 08:00 AM. Previous unstarred jobs are cleared automatically to keep the dashboard clean. Starred leads are preserved across cycles.

CLEAR_POLICY

UNSTARRED → DROP

PRESERVE

STARRED → KEEP

// FRESH_OPPORTUNITIES

Daily Auto-Refresh

Scheduler runs daily at 8:00 AM, automatically clearing out previous unstarred jobs to keep the dashboard clean.

// STARRED_PRESERVATION

Starred Jobs Preservation

Preserves your starred leads across daily refresh cycles so nothing important is ever lost.

// AGGREGATED_SCRAPING

Aggregated Scraping

JobScrapingAgent queries Indeed, LinkedIn, Glassdoor (via JobSpy) and Naukri, Apna, Shine, Foundit (via custom Playwright scrapers) concurrently.

JOBSPY

PLAYWRIGHT

// AGENTMAIL_DIGEST

AgentMail Digest

Emails the Top 10 matches in a premium HTML digest and attaches a complete compiled CSV of all leads.

TOP_10_HTML

FULL_CSV

Profile Ingestion & Hindsight Memory Bank

// STEP_01

Dynamic Onboarding

Connects GitHub, LeetCode, and LinkedIn as primary source streams.

GITHUB

LEETCODE

LINKEDIN

// STEP_02

Verification Agent

Crawls and checks Git logs to verify actual authorship, filtering out template forks.

GIT_LOG_CRAWL

// STEP_03

Hindsight Vector Memory

Synthesizes a factual, structured Markdown profile and indexes it in our vector store.

MARKDOWN

VECTOR_DB

// STEP_04

Adaptive Memory

Learns candidate domain preferences (roles, locations, tech stacks) over time.

LEARNING_LOOP

// HINDSIGHT_VECTOR_MEMORY

Factual, Structured, Indexable.

Each candidate profile is distilled into a single source-of-truth Markdown document. Claims are tied back to verified Git commits and LeetCode submissions. The document is embedded and indexed in a vector store so downstream agents can run semantic recall during job-tailoring loops.

EMB_01

EMB_02

EMB_03

...

// ADAPTIVE_PREFERENCES

Learns What You Actually Want.

The memory bank tracks which jobs you star, ignore, and apply to. Over time it builds a preference vector across roles, locations, tech stacks, and seniority bands — refining the daily digest to surface leads you'll actually care about.
